

## Environmental policy

Novalca Srl is committed to improving the effectiveness and efficiency of its processes, minimizing the environmental impact of its activities. We comply with current regulations and all applicable environmental requirements, continuously monitoring our environmental performance.

Where economically feasible, we adopt the best available technologies to prevent pollution and ensure high environmental protection standards. We strive to reduce energy and natural resource consumption through responsible practices and strategic planning. We mitigate the environmental impact of new activities by implementing a systematic approach to environmental management.

We encourage our customers to properly separate waste and prioritize recovery over disposal. We believe that employee involvement is essential for the effective implementation of environmental guidelines and the continuous improvement of our strategies.

In this framework, we have introduced the **REC (Recycled Engineering Compounds)** product line, designed to reduce environmental impact in terms of CO<sub>2</sub> emissions, water, and energy consumption. Our goal is to provide sustainable materials without compromising quality, actively contributing to the ecological transition.

Our company operates responsibly, fostering a production model that prioritizes environmental protection and the well-being of future generations.
